Linked Media Framework PC/Windows

Apache Marmotta: Integration and search engine. User interface (UI): Extensible, REST-based web framework for building and submitting queries to endpoints. Apache Stanbol: Semantic repositories. User interface (UI): Mediate between the Semantic repository and the client. Apache Solr: The Lucene search engine. User interface (UI): Solr provides online search and is used by the Apache Stanbol. Linked Media Framework provides advanced storage capabilities and can be used to combine the results of the three Apache projects: Apache Marmotta, Apache Stanbol, and Apache Solr. This post focuses on the technical and functional aspects of Linked Media Framework. This post does not focus on the benefits of using Linked Media Framework as a whole. There are plenty of other posts for that, if you are interested. Review Summary: Apache Marmotta Apache Marmotta is an open source, REST-based web framework that is used to build and submit queries to endpoints. Apache Marmotta is a library which helps you to write web projects quickly and easily. It's a pretty small library (under 300 lines of code). Apache Stanbol Apache Stanbol is a Semantic Search Engine. It provides the capabilities of a search engine for RDF resources, allowing you to search not only for document content, but also for metadata about document content. Apache Stanbol has an easy to use user interface, using Representational State Transfer (REST) API. Apache Solr Apache Solr is an open source, search engine based on open source Lucene. It is mainly a Java search engine. What's New In Linked Media Framework?

A Very Brief Look at LastPass Stephan Vanroose One of the most widely used and secure online password managers available is LastPass. Introduced in August 2008, LastPass is a password management and autofill service that saves your passwords for you. Today, we will use the LastPass authentication plugin to log into our LastPass account and perform a number of tasks. Preparations: LastPass uses a user domain to connect to its service. Depending on your configuration, the service may reside either on your computer or on a centralized server. In both cases, users need to register an account with a username and a password. This article assumes that you are logged into a LastPass account using your computer. If you are already logged in using your LastPass account, skip to the next section. If you are not logged into a LastPass account, follow the instructions in the 2. Installation section. 1. Adding new accounts Login to your account and click on the three dots button in the top right corner. From the main menu, select Add New Account and follow the instructions. 2. Adding new domains In addition to adding a new account, the same menu offers you to add a new domain. In this section, we will add a new LastPass domain to our account. Open the Details window and add a new domain. Please use the name you would like your new domain to have in your LastPass account. 3. Adding your OpenID OpenID is an authentication protocol proposed by OpenID Foundation to allow users to authenticate themselves. Services that support OpenID use a mechanism called OpenID provider to authenticate their users. Your LastPass account can be associated with one or more OpenID providers, but we will not use this feature here. We will log in with our username and password. Adding a new OpenID to your account can be done by adding a new OpenID provider. Open the domain you just added and click on the three dots button in the top right corner. The OpenID provider window will open. Select OpenID provider and click the Add button. 4. Adding an Autofill Service LastPass allows you to fill in forms using your saved passwords. For example, when we are on an Amazon webpage, we might need to fill in the username and password of our account. LastPass will automatically fill in the username and password
