"A system which has the capacity to do that must be quantum in nature." Smolin and his group suggest that "space," "time" and "matter" are emergent properties of the quantum universe and that the collapse of the wavefunction under gravity, which reduces the number of possibilities to a few, was responsible for the existence of these macroscopic things. In this scenario, the universe contains all possible microscopic possibilities, or what's known as the multiverse, but the probability of any particular configuration is zero. As particles branch off from the common original state, the chances of them colliding are equal, leaving "space" as the only leftover. "It's like going to a fair," Smolin said. "Say you want to see a blue horse. Now you go to a fair and go through four doors. In the first three doors, there's a red horse. In the fourth, there's a blue horse. You could choose door number four. However, at that door, you'll find a blue horse. But there's no guarantee that the red horse you're going to see is going to be a horse of color. "Now if you could look into the fourth door and know for sure that the horse you're going to see is a blue horse, you're a better person. The problem is, you can't," he said.
