AutoCAD users frequently edit CAD files to correct problems, to complete design tasks or to produce output for new or additional workspaces. A popular option in AutoCAD is to include the results of edits to the original document in an automatically generated “autosave” copy of the file. The autosave file is also known as a “snapshot” or “current” and it resides in the same location as the original file, but it is a copy of the original file. When the user returns to the original file, the autosave file is loaded automatically, allowing the user to edit the autosave file. If the user closes the original file and continues work in the autosave file, then all the changes to the autosave file will be made to the original file upon loading. If the autosave file was also created by the user, then the user can modify the autosave file and return to the original file. The autosave option is a convenient way for a user to capture the results of the user's changes and return to them later, but the autosave option has also been exploited by some users to save their work to the cloud. If the user closes their original file and chooses to save their work to the cloud, then the changes to the autosave file are sent to the cloud where they are stored as a revision. As a user works, the user's work is automatically saved to a revision stored in the cloud. AutoCAD sends the user a notification when it saves the user's work to a revision in the cloud. If the user closes the AutoCAD application, then the original file and the revision stored in the cloud are both deleted. Some users may create an empty file and save their work to the cloud. Later, the user can restore the work to the file. AutoCAD can send data to the cloud for the purpose of storing a user's work. If the user opens the file saved to the cloud, AutoCAD automatically connects to a cloud service to retrieve the file. A user may have multiple cloud accounts. The user's AutoCAD subscription account may be tied to one or more cloud accounts. The AutoCAD Connect Cloud Connect service sends data to the cloud in a single file for storage. The user's AutoCAD subscription account may be tied to a computer that is used to connect to the cloud. This feature can be used to keep multiple AutoCAD files synchronized

This sounds simple enough, but I'm having some issues getting it to work. What I'm after is something like this:
