We observe that the state is triggered when the GRIN becomes strongly nonlinear, while when $\lambda_{\text{min}} < \lambda_{\text{max}}$. A more detailed explanation for this observation can be found in Ref. [Dunietz, experimental, 2014], where it is shown that a Gaussian profile is a result of the small- k approximation in equation. Thus, in the high-risk state, the beam will remain nearly Gaussian as the lens will only capture a small number of modes.  High-precision and tunable volume measurement based on spatial phase-shifting technique with a water-immersion objective. The spatial phase-shifting method (PSM) is a high-precision technique for volume measurement. In this work, we introduced the PSM technique with a water-immersion objective. As a result, the volumes of samples with different refractive index can be measured by the PSM technique. The sampling regions and the number of sampled points for PSM and plane c6a93da74d
