
Flatout 2 Split Screen Pc Mod 41 VERIFIED

after i changed the auto rotate to "off", my screens still rotate when i turn my chromebook over. i tried to manually rotate the screens with "rotate left/right", when i tried to set the screens to match (a typical 1920x1080 and 2560x1440), everything is working fine except for all my screen modes are being listed, not just the ones that are available in extended mode. one problem i have is in extended mode, if i try to change the screen mode, it says that there are no other screen modes available because i'm in extended mode. if i turn to show on 1 screen, it will list all of my screen modes, but it will only show 2560x1440, not 1920x1080. if i choose "show on 1 screen" nothing changes, i.e. no screen mode changes, so it looks like it still just thinks it's in extended mode. however, when i turn to show on 1 screen, the settings changed to 2560x1440. if i turn it back to extended mode, it still lists all of my available screen modes, but it won't go to any of them. any ideas what might be causing my screen mode to reset to 2560x1440? the game crashed after i had modified the background with a black image when suddenly a message appeared saying that "yes the game crashed" (with no error messages or clear thing displayed. a few hours later it locked up on me when i tried to play on the ps4, which is very unusual, as it usually runs fine on the consoles. anybody else had this problem? just noticed this new mod. hope it runs fine on the gt opus, especially with the opus' performance being pretty good and better than the gt.) has anyone tried this mod, any bugs? i would really like to try it out.

I guess I should go into my history with the Split keyboards. The original flatout got a lot of that love, in part because it was the first split. But that's not what inspired me to start on another, a lot of it was from how the original was designed with a practical application in mind. A brief history of the split keyboard started with the first flatout, which was all about being able to program small things like 7-segment displays out of a [Trixbox] clone. This seemed like a good thing to do. If you find that split keyboard to be tight and a little awkward to use, chances are it was originally designed for a tiny target platform. So to build a bigger keyboard, it starts to make more sense to design it from the ground up to be bigger, for whatever practical purpose. Originally the goal was to make it into a laptop replacement, to do that you need a lot of space for a lot of keyboards, so it seemed logical to put a bigger keyboard in the top half, and keep the screen in the bottom half, at least until you need to do some heavy number crunching. The layout was an obvious starting point, and the [chonky palmtop] saw fit as a great way to show off the keyboard. So the goal of flatout 1 was having to do simple stuff, and the goal of flatout 2 was to make a split keyboard you could use for everything. And it seems to be working. The plan so far is to have a more modular approach. I will be building a smaller desktop PC with raspi, just to power a monitor and keyboard, and attach to a keyboard with more surface area. I don't plan to run two screens from it, but you can if you want. If you just want to hook up an old 1366x768 monitor, you can attach the right half of the keyboard over the keybed, or if you have a tablet it can sit on the left half. Either way is pretty satisfying. 5ec8ef588b
