works behind the scenes. I'm starting at the low level now, but my final goal is to get some of my own WebGL animations running in Web Workers and then use the Data URL scheme to send the data back and forth between the main and worker processes.

WebGL Canvas Element

The WebGL canvas is a 2D graphics context that is compatible with the 2D Canvas API standard. It is a 2D context where WebGL functions are performed. It can also be used for many different purposes. Similar to the HTML5 canvas tag, canvas can be used to draw shapes, create images, animations, etc..

WebGL and Web Workers

Canvas context is used by the HTML5 web worker. If a canvas element is used in a web worker, it becomes a shared web worker canvas. Web workers communicate directly with each other. They are separated from the main UI thread.

Loading / Rendering Graphics

The HTML canvas is the standard way to render graphics on the web. When an element is created it will be available for drawing. Canvas supports 8-bit and 24-bit color graphics which is usually the method people use to render simple images like faces, animals, etc.

OpenGL Rendering

OpenGL is a very popular rendering API that is found in many different graphics cards used in regular computers. It is a

more advanced API that is often used for offscreen rendering and the purpose of graphics cards. While the WebGL API uses the canvas element, it can also be used
