started with Pack Attachments
There are a couple of reasons
why someone needs to take an
email attachment and compress
it in ZIP archives. The most
obvious is to free up email
attachment space. It is necessary
to highlight that this is the case
if the attachment data exceeds
the size of the email body,
which, on the other hand, cannot
be compressed. Another reason
to compress email attachments
into ZIP archives is to facilitate

the transmission of attachments. In this case, the attachment is represented by a MIME file. It is a popular format because the content of such files can be compressed. One more advantage of making email attachments into ZIP archives is that it removes attachment data from the inbox. When you receive an email and download attachments for them, you may not realize until it's too late that more data is being downloaded

than needed. If you have ever tried to clean up an inbox with many attachments, you know that this can take a lot of time. Moreover, you have to remember how many attachments you downloaded for each email. This information is often spread out over several files. This can be beneficial if you are not only copying a data file but also sending a file in a separate,

attached message. Allows attachment data to be removed from the inbox. Obviously, you can do away with the attachments from the inbox.
