The game engine used to make this Game Breaking Box is designed to be stable and allow games to be played online. The Game Engine that made this game included: Lua - A high level scripting language specially designed for the engine. Intel's x86 emulator and ASM - A compiled version of the popular ARM Assembly language The Lua team have worked with every aspect of the engine to produce an engine that can be played online and this included adding on their own features. Lua was used to parse the instructions of the player's actions allowing the game to be an interactive experience and not just a series of 'Yes' and 'No' boxes. The Lua scripting was used to streamline the main core of the game and to allow individual pieces to be easily swapped. The ASM was used to handle the player input system allowing the game to be playable in many platforms. The x86 emulator is used to emulate the PC architecture of Intel based operating systems. This allows the game to be played on a variety of platforms, some of which do not have the performance requirements for high end games. For more information on the version of the engine used to make this game, click on this link. More interesting information on the development of this game can be found on the developers blog. This is a free to play game. If you like the game you can buy ingame items with real money to help support the game team. These items will not affect the way the game is played and will not be a part of your achievement/ranking stats. © 2011, Back Yard Studios Ltd. A chance for a new maid cafe in Japan

Prototype TD is a tower defense game which includes rogue-like elements to make each game different. The challenge of the game is in adapting to the situation you are given and figuring out what combinations of towers and map layouts will be most effective in each individual game. In many tower defense games you figure out several towers which work well and use them to win the same way each time. You also learn what spots on the map are useful and then don't have much reason to innovate further. In Prototype TD you build your map by placing blockers which the enemies have to go around, and the starting map is randomly generated so every game requires you to think carefully about how you place your walls and towers. The game includes a set of towers and other bonuses which can be useful to the player, but they are not all available every game. After every 5th round, the player is given a choice of bonuses which are randomly selected, so the player must decide what is most useful to the current game and figure out what combinations of towers are strong. Across several games it becomes necessary to learn and use each tower type when the right situation arises, or to pass up on a strong tower which doesn't fit the current map. The towers themselves explore various different ways of dealing damage or interfering with enemies. The upgrade system allows for the possibility of winning with one tower that is heavily boosted or winning with a lot of towers with less upgrades on each one. Which route you choose depends on what towers and boosts you gain access to in a particular game. This game includes the best of my ideas for the tower defense game I want to play, and I enjoy playing it. If you play it and have ideas about interesting new tower types or game modes that you think would be fun, please tell me about them and I will be open to building on the game further with updates. * Features * - Nearly endless maps to play through - Randomized map sizes and tile sets - 3 distinct enemy types and 2 tower classes - Ability to build fences - Ability to build mega-towers - Weak, medium, and strong towers available each round - Kill an enemy with a specific strength type to gain access to a variety of bonuses - Chance of winning with a single tower (different from the one building it) - Chance to win with a different set of towers each round - Chance to upgrade a tower a certain number of times to make it stronger - Ability to randomize tower bonuses each round - Ability to build
