Dictionary of the World␣s Languages shows 1400 languages and 80,000 words with pronunciation, ISO code, transliteration (Romanization), and short form. It supports multi-lingual

interface. If you like the idea of OCR and now you want a new OCR with two or multi-page support, Amsiv Machine Learning will be for you. Amsiv Machine Learning is a Java-based utility, that uses neural networks to process scanned texts. It supports Unicode and Unicode16. Upon launch, Amsiv Machine Learning does an automatic scan for potentially valid files and asks for the quality of the scanned document. After that, if it succeeds, it will then prepare the next step. It is important

to state that all scanned document are stored into a temporary folder so that you can recover any unimportant files. The quality of the document is then compared to the algorithm of the program and the results are filtered. After that, if the desired text is found, it is saved in the temporary folder. The interface is rather simple and it consists of a few buttons, where you can set the desired text type, saving location, adding a title to the file, etc. The software is very stable and does not display any error

or crash even when the text in the document is rather complex. Apart from that, the application can also handle Polish, Czech, Spanish, German, Italian, Catalan, Hungarian, Portuguese, Russian, French, and Dutch, while you can easily convert between English and many other languages, due to the built-in converter. It does not present any significant downside and you can use Amsiv Machine Learning as many times as you want for as many files as you need. Amsiv Machine Learning
