System Requirements: MS Windows XP/Vista/7/8/8.1/10 or a 64-bit Windows version File Type Manager Screenshots: Below you can see the main window of the tool, which resembles the classic Windows appearance. Moreover, once File Type Manager is running, its interface does not lock itself. The main panel displays a tabbed window with tabs for file types, actions and shell extensions, among others. The icons present on the left side of the window can be dragged around the panel. Each item present on the panel can be moved, closed and opened, which saves time because it is a waste of time to open the program, select an item, and then close it again. By clicking on the name of any file type, such as text, a split panel will open on the bottom of the screen that shows all of the file types belonging to that particular file type. In addition to that, clicking on any item, such as a shell extension, will open the attributes of the selected item, which shows information like whether it is enabled or disabled, the file type's file type icon, and, if applicable, the association of the selected item to the file type. There is also a small pane at the top of the window, which shows the file type's file extension, file type icon and flags. These are displayed by default, but you can change the order and positions of the icons in the left panel. Clicking on the file type's file type icon will open a more detailed view of that item. To add a new file type, select it from the list on the left or press Ctrl+A. You can input the type's name, extension, icon (ICO) and flags, among other details, like Windows shortcuts. If you select a file type, the executable associated to that file type will be opened and will be displayed to you. In order to edit a file type, select it from the list on the left or press Ctrl+E.
