The angiotensin-(1-7) [Ang-(1-7)] receptor is a counter-regulatory receptor to the angiotensin II [Ang II] type 1 receptor (AT(1)). The existence and function of Ang-(1-7) receptors in the kidney are unknown. We tested the effects of Ang-(1-7) on water and electrolyte excretion in the isolated perfused rat kidney, and compared these effects with those induced by a non-AT(1) angiotensin receptor agonist, [Sar(1)-Ile8] Ang II. We also tested the effects of the Mas receptor antagonist A-779 on the actions of Ang-(1-7). Ang-(1-7) (0.1-10 nmol) increased water and electrolyte excretion to a similar extent as [Sar(1)-Ile8] Ang II (0.1 nmol). A-779 had no effect on the water and electrolyte responses to Ang-(1-7) and [Sar(1)-Ile8] Ang II. These results suggest that the Ang-(1-7) receptor is a non-AT(1) Ang II receptor in the rat kidney and that the Mas receptor is not involved in the actions of Ang-(1-7).
